Management and the Wealth of Nations

John Van Reenen (LSE)

October 23rd 2015

Italian Economic Association, Naples

Draws heavily on joint work with Nick Bloom (Stanford) and Raffaella Sadun (HBS)
OR... BOSS-ONOMICS
MOTIVATION

• Evidence of extensive firms & plant productivity (TFP) differences (e.g. Syverson, 2011)

• Finding has influenced many fields: trade (e.g. Melitz, 2003), labor (e.g. Card, Heining & Kline, 2013), macro (Hsieh & Klenow, 2009), IO etc.

• Argument of this talk:
  – Firm productivity related to certain core management practices
  – Some management practices are like a technology, not simply different contingent styles (cf. Woodward, 1958)
  – Management matters a lot in explaining macro TFP gaps (~30% on average)
LARGE PRODUCTIVITY DIFFERENCES BETWEEN COUNTRIES

Total Factor Productivity, 2000

Per Capita GDP, 2000

Source: Jones and Romer (2010). US=1
“It is on account of the wide range [of managerial ability] among the employers of labor that we have the phenomenon in every community and in every trade some employers realizing no profits at all, while others are making fair profits; others, again, large profits; others, still, colossal profits.”

Francis Walker (Quarterly Journal of Economics, ‘87)
It is on account of the wide range [of managerial ability] among the employers of labor that we have the phenomenon in every community and in every trade some employers realizing no profits at all, while others are making fair profits; others, again, large profits; others, still, colossal profits.

Firm heterogeneity has long been recognized with possible link to management.

Francis Walker (Quarterly Journal of Economics, 1887)
FIRM HETEROGENEITY HAS LONG BEEN RECOGNIZED WITH POSSIBLE LINK TO MANAGEMENT

It is on account of the wide range [of managerial ability] among the employers of labor that we have the phenomenon in every community and in every trade some employers realizing no profits at all, while others are making large profits; others, still, colossal.

Alfred Marshall (QJE, July 1887, 1(4)) response
But there is still a wide debate – many people claim management is just “hot air”

“No potential driving factor of productivity has seen a higher ratio of speculation to empirical study”

- Chad Syversson (2011, Journal of Economic Literature)
Measuring Management

Management Models

Data Description

Empirics
1) Developing management questions
   • Scorecard for 18 monitoring (e.g. lean), targets & people (e.g. pay, promotions, retention and hiring). ≈45 minute phone interview of manufacturing plant managers

2) Obtaining unbiased comparable responses ("Double-blind")
   • Interviewers do not know the company’s performance
   • Managers are not informed (in advance) they are scored
   • Run from LSE, with same training and country rotation

3) Getting firms to participate in the interview
   • Introduced as “Lean-manufacturing” interview, no financials
   • Official Endorsement: Bundesbank, Bank of England, RBI, etc.
   • Run by 200 MBA types (loud, assertive & business experience)
MONITORING – e.g. “HOW IS PERFORMANCE TRACKED?”

<table>
<thead>
<tr>
<th>Score</th>
<th>(1): Measures tracked do not indicate directly if overall business objectives are being met. Certain processes aren’t tracked at all</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(3): Most key performance indicators are tracked formally. Tracking is overseen by senior management</td>
</tr>
<tr>
<td></td>
<td>(5): Performance is continuously tracked and communicated, both formally and informally, to all staff using a range of visual management tools</td>
</tr>
</tbody>
</table>

**Note:** All 18 questions and over 50 examples in Bloom & Van Reenen (2007)

http://worldmanagementsurvey.org/
Examples of performance metrics – Car Plant
Examples of a performance metrics – Hospital
| Score | (1) People are promoted primarily upon the basis of tenure, irrespective of performance (ability & effort) | (3) People are promoted primarily upon the basis of performance | (5) We actively identify, develop and promote our top performers |

**Note:** All 18 questions and over 50 examples in Bloom & Van Reenen (2007)  
http://worldmanagementsurvey.org/

Medium sized manufacturing firms (50-5,000 workers, median ≈ 250)

Now extended to Hospitals, Retail, Schools, etc.
Average Management Scores by Country

Note: Unweighted average management scores (raw data) with number of observations. All waves pooled (2004-2014)
Average management scores across countries are strongly correlated with GDP per capita.

Note: Unweighted average management scores (raw data) with number of observations. All waves pooled (2004-2014).
Large variation of firm management within countries

Firms with 50 to 5000 employees randomly surveyed from country population. Mar 2014.
Schools and Hospitals: spread on 16 identical questions

- US
- Sweden
- India
- Italy

Graphs showing the distribution of responses to questions related to schools, hospitals, and manufacturing in different countries.
Foreign Multinationals appear to transplant management overseas.

Source: Bloom, Sadun and Van Reenen (2015) “Management as a technology)
Management varies heavily by ownership type

- Dispersed Shareholders: 3,879
- Private Equity: 476
- Family owned, external CEO: 650
- Managers: 276
- Private Individuals & other: 2,548
- Government: 301
- Family owned, family CEO: 2,467
- Founder owned, founder CEO: 3,200

Management score varies significantly.

Notes: Data from 14,686 firm interviews. Created May 2015. Source: [www.worldmanagementsurvey.com](http://www.worldmanagementsurvey.com)
Measuring Management

Management Models

Data Description

Empirics
ECONOMIC PERSPECTIVES ON MANAGEMENT

• Management as Design
  – Organizational Economics (Gibbons and Roberts HOE, 2013) e.g. Personnel Economics
  – Contingent management School (Woodward, 1958)
  – Optimal “styles” of management

• Management as a Technology (MAT)
  – Management a part of firm’s TFP (intangible capital)
  – Consider simple model: dynamic equilibrium model with firm heterogeneity in productivity & imperfect competition
We define a *stylized* Management As a Technology (MAT) model (Bloom, Sadun & Van Reenen, 2015)

Production Function: \( Y = A K^\alpha L^\beta M^\gamma \) where \( M = \) management

Firms invest in \( M \) (intangible capital) which depreciates like \( K \), but unlike \( K \), firms draw an endowment at entry (Hopenhayn, 1992; Melitz, 2003)

Other assumptions:
- \( A \) also drawn randomly at entry \((K_0=0)\) from known distribution. Hit by ongoing \( A \) shocks
- Changing \( M \) & \( K \) involves adjustment costs \((L \) flexible\)
- Monopolistic competition \((\text{Iso-elastic demand}, e)\)
- Sunk entry cost \((\kappa)\) & fixed per period operating cost \((F)\)
Timing of firm decisions

1. Entrants pay a sunk cost $\kappa$ for a draw on $(A,M)$. Free entry condition determines number of firms

2. Each period firm gets TFP shock, $\varepsilon_{it}$; $\ln A_{it} = \rho \ln A_{ti-1} + \varepsilon_{it}$

3. Pay fixed operating cost $F$ per period (or exit)

4. Invest in $M$ & $K$ (investment “price” + quadratic adjust cost)

5. Choose labor (fully flexible)
Model has 15 parameters – 9 taken from prior literature, 2 normalized, and 4 estimated by SMM

### Predefined parameters

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</tbody>
</table>

Notes: Estimation by SMM using management panel data 2004-2014. Calibrate 11 parameters – see Table 1: 9 from literature and two normalizations (Fixed cost=100 and mean of lnA=1). Run 100 years until steady state. Keep last 10 years of data
Predictions from numerical MAT model (Note not directly used in structural SMM estimation)

1) Performance ↑ in management

![Graph showing the relationship between Management and Log(Sales)]

**Notes:** Simulate 5,000 firms per year in the steady state using estimated parameters from SMM and calibrated parameters.
1) Performance ↑ in management

2) Management ↑ in competition

Notes: Simulate 5,000 firms per year in the steady state using estimated parameters from SMM and calibrated parameters.
Predictions from numerical MAT model (Note not directly used in structural SMM estimation)

3) Firm Age & management

4) Management & skill price

Firm Age increasing

Management price increasing

Notes: Simulate 5,000 firms per year in the steady state using estimated parameters from SMM and calibrated parameters. Plots normalized log(management)
Very stylized model with many possible extensions

- Governance & principal-agent issues: initial draw of M a reduced form way of proxying these problems

- Multi-factor: currently 1-dimensional M, but under “Design” model sub-components of management styles

- Management technology could be (partially) non-rival so spillovers (Bloom, Schankerman & Van Reenen, 2013)

- More generally, Rivkin (2000) on why better management practices aren’t adopted:
  - Information (later)
  - Incentives (our focus)
  - Co-ordination (Gibbons & Henderson, 2012)
Examining the Model’s Predictions

- Performance
- Competition
- Skills
- Age

Management and cross-country TFP
Data: Sales are increasing in management

Management is the average of all 18 questions (set to sd=1). Sales is log(sales) in US$. N=10197
Data: Firm size is increasing in management

Management is an average of all 18 questions (set to sd=1). TFP residuals of sales on capital, labor, skills controls plus a full set of SIC-3 industry, country and year dummies controls. N=8314
Performance in general is robustly *correlated* with management pretty much any way you cut the data

*M* Management Index is z-score of average 18 questions z-scored (sd=1). Other controls include % employees with college, av hours, firm age, 3-digit industry, country & time dummies & noise controls (e.g. interviewer dummies). Standard errors clustered by firm. In OP coefficients on L and K are from first & second stage estimation procedure.
Performance: results from randomized control trials also supportive of MAT (Bloom et al, 2013)

- Experimented on plants in Indian textile firms outside Mumbai

- Randomized treatment plants got heavy management consulting (as in the practices discussed here), control plants got very light consulting

- Collected weekly data & found:
  - Management score improved by 2sd & TFP up by 20%
  - Implies: 1 SD increase in management index caused 10% increase in TFP
MANY PARTS OF THE FACTORIES ARE DIRTY AND UNSAFE
THE FACTORIES ARE ALSO DISORGANIZED

Instrument not removed after use, blocking hallway.

Oil leaking from the machine

Cotton lying on the floor

Instrument blocking the hallway
THE TREATED FIRMS INTRODUCED BASIC INITIATIVES

Worker involved in “5S” initiative on the shop floor, marking out the area around the model machine

Snag tagging to identify the abnormalities on & around the machines, such as redundant materials, broken equipment, or accident areas. The operator and the maintenance team is responsible for removing these abnormalities.
Performance: causal results from randomized control trials also supportive of MAT

1 SD in management caused 10% increase in productivity

IS COMPETITION EFFECT CAUSAL?

• Also use natural experiments to generate exogenous increases in competition
• Trade liberalization following China accession to WTO & subsequent phase out of MFA quotas in textiles & apparel industries in 2005. Bloom, Draca & Van Reenen (2015, ReStud)
  — Strong first stage on Chinese imports into EU
  — Big improvement in management & productivity in more affected sectors
• Hospital competition in UK under Blair reforms (Bloom, Propper, Seiler & Van Reenen, ReStud, 2015)
Do more competitive (less distorted) markets have more reallocation towards better managed firms?

\[ Y_{ijk} = \alpha M_{ijk} + \beta (M \times \text{FRICTION})_{ijk} + \gamma \text{FRICTION}_{ijk} + u_{ijk} \]

- \( Y_{ijk} = \text{SIZE} \) (or \( \text{GROWTH} \)) for firm \( i \) in industry \( j \) country \( k \), and \( M \) is management

- \( \text{FRICTIONS} = \) Proxies for frictions to competition

- Key test is \( \beta < 0 \) (more competition = more reallocation)
Find the US – where markets generally most competitive – has the most reallocation

Examining the Model’s Predictions

- Performance
- Competition
- Skills
- Age

Management and cross-country TFP
Not good age information in our firm-level data. So use a Census Management Dataset (MOPS)

It was delivered to 47,534 manufacturing plants in 2011

This was quick and easy to fill out - and mandatory - so 78% of plants responded, covering 5.6m employees (>50% of US manufacturing employment)

Samples all ages & sizes
The impact of competition also shows up in US Census data – badly managed firms improve or exit.

Notes: Data from 31,793 plants from the Management and Organizational Practices survey.
Measuring Data

Management Models

Examining the Model’s Predictions
  • Performance
  • Competition
  • Skills
  • Age

Management and cross-country TFP
Following MAT we can estimate contribution of management to cross-country TFP differences

1. Estimate country differences in *size weighted* management

2. Impute impact of *size weighted* management on TFP

Requires many assumptions so rough magnitude calculation (in spirit of Development Accounting, Caselli, 2005)
Decomposition of the size weighted management (M) in each country we surveyed

\[ M \equiv \sum_i S_i M_i \]
Decomposition of the size weighted management ($M$) in each country we surveyed

$$M \equiv \sum_i S_i M_i$$

$$= \sum_i [(S_i - \bar{S})(M_i - \bar{M})] + \bar{M}$$

"Between Firm" Covariance
(Olley-Pakes, 1996, reallocation term)

"Within Firm" Unweighted mean of management score
Calculate the size weighted management gap with the US in terms of these “between” (reallocation) and “within” terms.

Notes: These are the share-weighted management score differences relative to the US (sd=1). Length of bar shows total deficit which is composed of (i) the unweighted average management scores (“rel_zman”, light red bar) and reallocation effect (“rel_OP” blue bar). Domestic firms only with management scores corrected for sampling selection bias.
Calculate the size weighted management gap with the US in terms of these “between” (reallocation) and “within” terms

Notes: These are the share-weighted management score differences relative to the US (sd=1). Length of bar shows total deficit which is composed of (i) the unweighted average management scores ("rel_zman", light red bar) and reallocation effect ("rel_OP" blue bar). Domestic firms only with management scores corrected for sampling selection bias.
Step 2: What fraction of country k’s TFP gap (with the US) can this management gap (with the US) explain?

\[
\% \text{ TFP gap accounted for by management} = \frac{\gamma \times (\bar{M}^k / \bar{M}^{US})}{\ln(TFP^k / TFP^{US})}
\]

where \(\gamma = \text{impact of M on TFP}\)
## Management accounts for ~30% of TFP Gap with US

**Note:** Management share imputed assuming that ↑1 SD management ≈ ↑ 10% TFP Using US MOPs on entire firm size distribution US figure is 21%
CONCLUSIONS

~30% cross-country TFP spread due to management (bigger for US-Southern EU difference, about 50%)

Data fits management as a “technology”, \( Y = AK^\alpha L^\beta M^\gamma \)

- Management improves firm performance
- Competition improves average management
- Skill supply positively correlated with M
- Management increasing with firm age

Some Next Steps:
- Management & managers (German IAB)
- Determinants (e.g. Gibbons and Henderson, 2012)
- Spillover & diffusion
- Plant vs. firm differences (US MOPs)
MY FAVOURITE QUOTES:

The traditional British Chat-Up

[Male manager speaking to an Australian female interviewer]

*Production Manager*: “Your accent is really cute and I love the way you talk. Do you fancy meeting up near the factory?”

*Interviewer* “Sorry, but I’m washing my hair every night for the next month….”
Production Manager: “Are you a Brahmin?”

Interviewer “Yes, why do you ask?”

Production manager “And are you married?”

Interviewer “No?”

Production manager “Excellent, excellent, my son is looking for a bride and I think you could be perfect. I must contact your parents to discuss this”
Interviewer: “Do staff sometimes end up doing the wrong sort of work for their skills?”

NHS Manager: “You mean like doctors doing nurses jobs, and nurses doing porter jobs? Yeah, all the time. Last week, we had to get the healthier patients to push around the beds for the sicker patients”

Interviewer: “Is this hospital for profit or not for profit”

Hospital Manager: “Oh no, this hospital is only for loss making”
Don’t get sick in India

*Interviewer*: “Do you offer acute care?”

*Switchboard*: “Yes ma’am we do”

*Interviewer*: “Do you have an orthopedic department?”

*Switchboard*: “Yes ma’am we do”

*Interviewer*: “What about a cardiology department?”

*Switchboard*: “Yes ma’am”

*Interviewer*: “Great – can you connect me to the ortho department”

*Switchboard*: “Sorry ma’am – I’m a patient here”

**MY FAVOURITE QUOTES:**
MY FAVOURITE QUOTES:

The bizarre

*Interviewer:* “[long silence]……hello, hello….are you still there….hello”

*Production Manager:* “……I’m sorry, I just got distracted by a submarine surfacing in front of my window”

The unbelievable

[Male manager speaking to a female interviewer]

*Production Manager:* “I would like you to call me “Daddy” when we talk”

[End of interview…]
Some quotes illustrate the African management approach

*Interviewer* “What kind of Key Performance Indicators do you use for performance tracking?”

*Manager:* “Performance tracking? That is the first I hear of this. Why should we spend money to track our performance? It is a waste of money!”

*Interviewer* “How do you identify production problems?”

*Production Manager:* “With my own eyes. It is very easy.”
Does Management Really Work?

How three essential practices can address even the most complex global problems

Megha Patnalk⁵, Itay Saporta-Eksten⁶ and John Van Reenen⁷

February 2014

The Census Bureau recently conducted a survey of management practices in over 13,000 firms across the US, the first large-scale survey of management in America. Analyzing the data reveals several striking results. First, more structured management practices are tightly related to higher levels of IT intensity in terms of a higher expenditure on IT and more on-line resource use. More structured management is strongly linked with superior performance: establishments adopting more structured practices for performance monitoring, target setting and rewards, and daily management processes enjoy greater productivity and profitability, higher rates of innovation and faster output growth. Second, there is a substantial dispersion of management practices across the sample of establishments. We find that 18% of establishments have adopted at least 75% of these more structured management practices, while 77% of establishments adopted less than 50% of these.

**MANAGEMENT AS A TECHNOLOGY?**

Nicholas Bloom⁎, Raffaella Sadun⁶ and John Van Reenen⁷

November 1st 2013

Abstract  
Are some management practices akin to a technology that can explain company and national performance, or do they simply alternative styles? We collect cross sectional and panel data on management practices across 8,000 firms in 20 countries across the Americas, Europe and Asia. We find the US has the highest weighted average management score, with around a quarter of this advantage due to more powerful reallocation effects.
